

Air X Thumb Restriction Splint

A low profile AirX wrap that allows uninterrupted finger function and provides adjustable support to the thumb CMC joint. Excellent in the treatment of osteoarthritis and medial subluxation. The adjustable strap can be wrapped around the first CMC and MCP joints to provide targeted joint support.

Provides wrist and thumb support for an array of injuries, conditions, pre-and post-operations such as:

- + Arthritis of the thumb
- + Arthrosis of the first CMC joint
- + Basal joint arthritis
- + CMC arthritis
- + CMC instability
- + Inflamed/Swollen thumb tendons
- + MCP/CMC Injury
- + Osteoarthritis
- + Overuse injuries
- + Repetitive Strain Injury (RSI)
- + Rheumatoid arthritis
- + Weakness of the thumb joint
- + Worn cartilage

The unique Air X fabric has the ability to transport moisture efficiently away from the body thanks to the layered fibre structures, which help promote moisture wicking.

Air X fabric is also a soft, lightweight material that perfectly follows the contours of the body. This means the Air X adapts and shapes itself to the individual wearing it, providing exceptional comfort, even for extended periods of a time.

Thumb isolation ensures movement and interaction are limited, allowing the thumb to rest and recuperate following an injury. Isolation allows the main CMC and MCP joints to rest, reducing inflammation, soreness, discomfort and pain.
